

Quote Request Information

Quote

In order to receive a preliminary quote from A&R Countertops, we need a rough drawing of the shape and dimensions of your cabinets or current countertops. They do not need to be exact, and we will always round up so if anything, numbers will decrease (assuming your drawings are right on with your template). Please specify if you want a quote on granite or quartz or both and if you would like us to quote you with sinks and/or additional services (tearout, backsplash, plumber, buildup). Once you've received your quote and decided you want to move forward, the next step is a 50% deposit to order material and sinks and to schedule your template. Post-template, we'll send you final confirmation of the information we have for your project for you to verify then, once we have your approval on that info, we will schedule your install and begin fabrication.

Pricing

If you're unable to take measurements, a square footage estimate will do for our purposes but please note that these numbers may vary, and we are not obligated to honor your originally quoted prices. Our off-the-slab square foot prices are all inclusive, meaning that your template, install, and everything in between are included, other than sales tax and add-ons such as tearout or a sink. If you are purchasing a "special order slab," you're purchasing all the material outright then we will charge you for labor on top of that. Labor is calculated by the square footage of your job. The labor, besides material costs, is all inclusive as well.

Edges

We offer six different edge profiles: straight, eased, full bullnose, half bullnose, ogee, and 1/4" bevel. The ogee edge is an additional fee, priced per lineal foot, and all five other options are included in your pricing at no extra cost.

Backsplash

4" tall backsplash is our standard height. Backsplash at this height or shorter is sold by the lineal foot. Backsplash that is any height above 4" is included into your square footage. Please note that if you have anything that restricts the height of your backsplash (e.g. vanity mirror), we will install your countertops and measure for the height of the backsplash at that time, then return at a later date to install your backsplash. This is to ensure that we do not end up cutting and installing backsplash that is the incorrect height.

How to measure your countertops for a quote:

1. Draw a rough diagram of the shape of your countertops so that you can go back and fill in measurements.
2. With a tape measure, start by taking the back measurement of the full countertop piece. Measurements off the back wall are important if there are any angles in your tops because the back accounts for more square footage than the front measurement would. Please start and end at each angle so that we can calculate the most accurate square footage.
3. If you have a piece that curves or is shaped irregularly, take dimensions from the widest point. This is because we will account for wasted material under some circumstances but also because, in doing so, you will account for more square footage when the physical template will not so, theoretically, your numbers post-template will decrease.

Once you've taken measurements of all sides of your countertops, depth included, please note which edges are against a wall, which are open (i.e. finished and taking an edge profile) and the location of any tall cabinets and appliances. If you are interested in granite or quartz backsplash, please also note where this will be located (kitchen only, baths only, etc.) and the preferred height.
